1. Suppose  $f_k(x) = \sum_{n=1}^k \frac{x}{n^\alpha(1+nx^2)}$  and  $E_L = [-L, L]$  for  $L \in \mathbb{N}$ . Then, we want to prove that for all  $\varepsilon > 0$ , there exists  $N \in \mathbb{N}$  s.t.  $|f_k(x) - f_l(x)| < \varepsilon$  for all  $k, l > N$  and all  $x \in I_L$ .

First, suppose that  $l > k > N$ , then

$$\begin{aligned} |f_k(x) - f_l(x)| &= \sum_{n=k}^l \frac{x}{n^\alpha(1+nx^2)} \\ &\leq \sum_{n=k}^l \frac{L}{n^\alpha(1+nL^2)} \end{aligned}$$
